

By focusing on recent advances, we summarize the applications of ZIF-8 in electrical energy storage devices, such as rechargeable batteries and supercapacitors. We ...

distribution, and high energy densities contribute to high storage capacities. MOFs are a new class of microporous material, which is the most promising to storage methane with high porosity, adjustable pores and variety of factors that can improve their methane storage capacity (Li et al., 2016). Zeolitic imidazolate

In this regard, zeolitic imidazolate frameworks (ZIFs), specifically ZIF-8, act as promising photocatalysts for environmental remediation and renewable energy applications. ZIF-8, a subclass of metal-organic ...

Here, surface-engineered Ag-deposited Zeolitic imidazolate framework-8 (ZIF-8) was developed (1-Ag@ZIF-8 and 2-Ag@ZIF-8) utilizing an electroactive biofilm for energy ...

The introduction of Ag nanoparticles into ZIF-8 leads to a large specific surface area and strong conductivity, resulting in improved energy storage capability. Metallic Ag nanoparticles can be synthesized via various methods, including electrochemical deposition, decomposition, microwave-assisted synthesis, and wet chemical processes [21,22].

The construction of uniform nanostructure with larger surface area electrodes is a huge challenge for the high-value added energy storage application. Herein, we demonstrates ZIF67@ZIF8 (core-shell) and ZIF8@ZIF67 (reverse core-shell) nanostructures using a low-cost wet chemical route and used them as supercapacitors.

Introduction. Lithium-sulfur batteries (LSBs) have been widely applied in energy storage equipment due to their ultra-high capacity (1675 mA h g^{-1}), natural abundance as well as low cost [1, 2]. However, several obstacles still restrict the practical applications of LSBs. On one hand, the poor conductivity and severe volume change of ...

Electrocatalytic hydrogen evolution reaction (HER), oxygen evolution reaction (OER), oxygen reduction reaction (ORR), and carbon dioxide reduction reaction (CO_2 RR) are significant reactions for solving the current energy shortage and increasingly serious environmental problems. Construction of new type and efficient materials for catalyzing these ...

In the past two decades, consumption of large amounts of fossil fuels energy and environmental problems are the major significant factors for energy crisis which demands the researchers have to be paid more attention to develop alternative clean and renewable energy sources [1], [2]. To solve the abovementioned issues as well as save energy, various ...

The emission of greenhouse gases is considered the leading cause of global warming, a threat that needs to be resolved urgently [1,2]. A lot of research has been devoted to replacing notorious fossil fuels with clean successors to control the level of atmospheric CO₂ at a sustainable state [3,4]. One well-known candidate is hydrogen gas, which is still the only ...

In modern era, energy consumption and storage plays vital role to complete economical and global requirements of human [1]. There are two types of energy sources namely [2] renewable (for example-solar energy, biomass derived carbon) and non-renewable (for example-fossil fuels, coal, wood, natural gas). Renewable energy sources produces clean ...

Solar energy, wind energy, and tidal energy are clean, efficient, and renewable energy sources that are ideal for replacing traditional fossil fuels. However, the intermittent nature of these energy sources makes it possible to develop and utilize them more effectively only by developing high-performance electrochemical energy storage (EES ...

Introduction. Tremendous attempts have been made by the scientific community to store and convert energy to meet the needs of renewable and uninterrupted energy and power sources for portable electronics, power-supply devices and powering vehicles. ... It is well accepted that the electrolyte is an essential constitute for energy storage ...

constructing large surface area ZIF8-based electrodes for high-value-added energy storage applications, particularly supercapacitors. 1. Introduction Tremendous attempts have been ...

Developing high-performance energy storage devices is important to meet the demand of high energy density and superior power output in various applications such as plug-in electric vehicles, backup power sources, portable laptops, and cell phones [1], [2]. Among the various energy storage systems, supercapacitor has gained significant attention due to its high ...

This study presents the development of a unique 2D ZIF-8/SnO₂@RuO₂ composite utilizing the hydrothermal process, for dual applications in energy storage devices and HER. We explain a straightforward approach to change ZIF-8 and Tin (IV) oxide (SnO₂) utilizing Ruthenium (IV) oxide (RuO₂) through a regulated hydrothermal technique, devoid of a ...

Therefore, these findings provide a pathway for constructing large surface area ZIF8-based electrodes for high-value-added energy storage applications, particularly supercapacitors. 1. ...

Carbon nanofibers are rapidly emerging as efficient electrode materials for energy storage. Given this, we established a simple in-situ technique to grow zeolitic imidazolate ...

To solve these issues above, a variety of carbonaceous materials have been proposed, including carbon

nanocages [22], carbon nanotubes/fibers [23, 24], and graphene [25], etc. Among them, three-dimensional (3D) superstructure carbon with specific morphologies and functionalities is a promising anode for PIBs due to its high specific surface area enabled by ...

Notable progresses have been made in developing 3D scaffolds for Mg metal storage. Yang et al. [15] have employed 3D Mg₃Bi₂ scaffolds with high surface area as Mg anode, which promotes uniform nucleation of Mg due to its good affinity. Yu et al. [16] have designed a novel MgO-wrapped Zn-skeleton, enabling a high Mg plating/stripping reversibility ...

Thus, more stable, and flexible chemical energy storage system become a better choice. As one of the promising electrochemical energy storage techniques, all vanadium redox flow battery (VRFB) has been applied widely due to its long-cycle life, environmental friendliness and the independent adjustable power and capacity [4,5].

To further prove the marvelous opportunity of CCGZ film for energy storage device, the static water contact angles ... The introduction of ZIF8 can offer abundant pore, and its N-doped carbon also provides more active sites for electrochemical reaction, as well as the final product ZnO can supply pseudocapacitance for this system. ...

Herein, we elaborately construct N/DC coupling sites in N-doped carbon derived from ZIF8/NaBr mixture (denoted as ZIF8/NaBr-1-900) by the domain-confined etching strategy of ZnO. The presence of NaBr can greatly promote the transformation of Zn-N₄ moieties into endogenous ZnO via a "bait and switch" mechanism, and thus etches carbon matrix adjacent ...

The PBI-UiO66 membranes slightly outperform the PBI-ZIF8 membranes due to having lower activation energy for the proton conduction mechanism. Even though the H₂ permeabilities of the PA-doped PBI membranes are decreased with the addition of MOF particles, the H₂ permeabilities of the PA-doped PBI-MOF membranes are still higher than that of ...

Zeolitic imidazolate frameworks (ZIFs) are a sub-branch of MOFs, consisting of transition metal ions and imidazolate linkers, which leave porous N-doped carbon frameworks after carbonization, and have been widely used in supercapacitors, electrocatalysis and so on [12]. ZIFs possess distinct characteristics, such as adjustable size and pore size distribution, ...

Our study presents the rational design and synthesis of a hybrid material (ZIF-8@BiPO₄) with dual functionality: an outstanding supercapacitor electrode and an excellent photocatalyst. The ZIF-8@BiPO₄ hybrid structure ...

Among all energy storage devices, ... Benefited from the introduction of ion conducting ionic liquid, ZIF-8@EMI-TFSI coating shows an ionic conductivity ranging from 3.58×10^{-4} to 8.27×10^{-4} S/cm. As buckets effect reveals, ...

The emerging applications of MXene/ZIF composites span across various fields, including energy storage, catalysis, sensing, and environmental remediation [11]. For instance, MXene/ZIF-8 composites have shown promise in developing high-performance supercapacitors with increased energy and power density [21], [22], [23]. They have also been explored as ...

The construction of uniform nanostructure with larger surface area electrodes is a huge challenge for the high-value added energy storage application. Herein, we demonstrate ZIF67@ZIF8 (core-shell) and ZIF8@ZIF67 (reverse core-shell) nanostructures using a low-cost wet chemical route and used them as supercapacitors. Pristine ZIF-67 and ZIF-8 was used as ...

The introduction of Ag nanoparticles into ZIF-8 leads to a large specific surface area and strong conductivity, resulting in improved energy storage capability. Metallic Ag nanoparticles can be synthesized via various methods, including electrochemical deposition, decomposition, microwave-assisted synthesis, and wet chemical processes [21, 22].

Integrating 2D architecture, RuO₂ doping, and enhanced electrochemical performance positions ZIF-8/SnO₂@RuO₂ as a distinctive and promising material for ...

Therefore, developing electrochemical energy storage, hydrogen energy storage, thermal energy storage, and other ways of energy conversion to consume new energy power which cannot be effectively grid-connected transportation has become a hot spot [[4], [5], [6]]. The idea of hydrogen energy storage is to produce hydrogen by electrolysis of ...
